

WavePM

Helmholtz Perforated Cloud

The newest edition to our extensive line of Wave products offers unique absorption qualities in addition to the reflective nature of the design.

The perforations in the face of the unit vary dependant on the acoustic requirements of the room design. In most cases, frequencies below 200Hz are reflective and the absorption may be controlled by both hole size and the amount and depth of absorptive material on the back of the cloud.

Specifications: Single frame or coupled cloud frame styles available
8', 10', 12', 16' and 20' radius' available as well as flat mono
Any wood species as well as PLAM and painted finishes
Absorption test data available at www.RealAcoustix.com
